**Domain: Healthcare 🏥**

**Chosen Target User Group: Hospital Nurse Managing Patient Records**

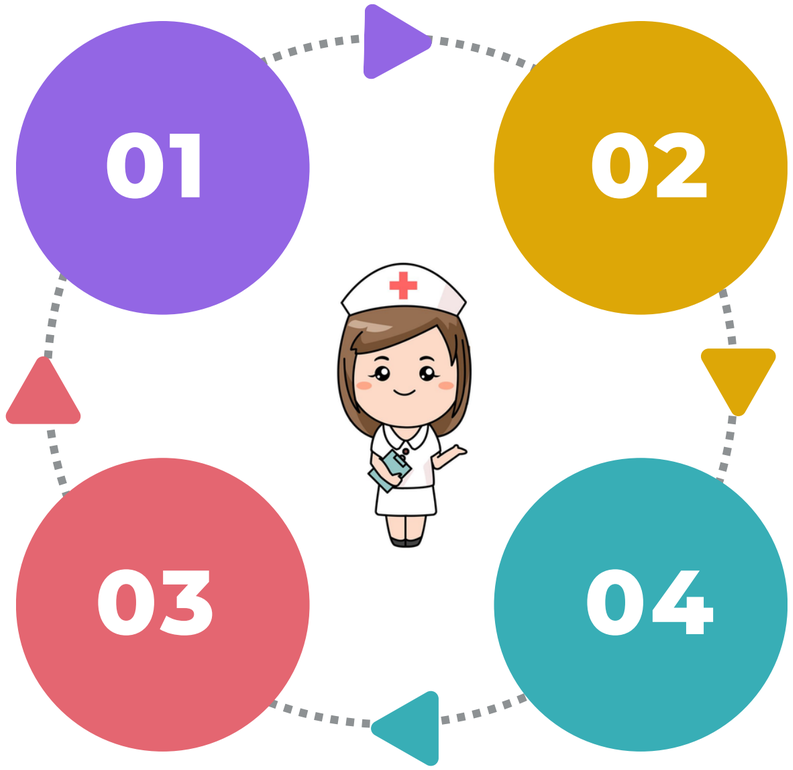
# 1. User Profile – Hospital Nurse Managing Patient Records

## User Role

- Hospital nurse responsible for monitoring patients and maintaining accurate patient records.
- Regularly updates electronic health records (EHR), medication details, and patient observations during shifts.

## Environment

- Works in a busy hospital ward or clinical unit with multiple patients.
- Uses computers or tablets connected to electronic health record systems.
- Operates in a fast-paced environment with time pressure, frequent interruptions, and emergency situations.



## Background

- Typically has nursing training with 2–10 years of clinical experience.
- Familiar with hospital information systems but not necessarily highly technical.
- Handles multiple responsibilities including patient care, documentation, communication with doctors, and coordination with other medical staff.

## Goals / Motivations

- Maintain accurate and up-to-date patient records.
- Ensure patient safety by properly documenting treatments and observations.
- Complete documentation efficiently to spend more time on direct patient care.
- Reduce errors and delays in medical information updates.

# 2. Empathy Map – Hospital Nurse Managing Patient Records

## THINKS & FEELS

- Fear of documentation errors
- Stress from heavy workload
- Frustration with slow systems
- Pressure to finish records on time
- Desire to focus on patient care

## HEARS

- Doctor's treatment instructions
- Patient and family requests
- Management documentation rules
- Colleagues discussing workload
- Policy and compliance reminders

## SEES

- Busy hospital ward
- Multiple record systems
- Constant patient monitoring
- Doctors requesting updates
- Frequent interruptions

## SAYS & DOES

- "I must update records quickly."
- Records vitals and medications
- Communicates patient updates
- Uses EHR during shifts
- Completes records after emergencies

## PAIN POINTS

- Time-consuming data entry
- Repeated information input
- Complex EHR interfaces
- Limited time for documentation
- Extra time after shifts

## NEEDS / GAINS

- Faster documentation tools
- Integrated record systems
- Reduced manual data entry
- More time for patients
- Efficient workflow

# 3. Problem Statement Canvas – Hospital Nurse Managing Patient Records

## USER

**Who experiences the problem?**

- Hospital nurses responsible for patient documentation
- Nurses managing electronic health records during shifts

## PROBLEM

**What is the core challenge or unmet need?**

- Excessive time spent on manual patient record entry
- Multiple systems requiring repeated documentation

## CONTEXT

**When and where does this problem occur?**

- During busy hospital shifts
- While managing multiple patients in wards

## IMPACT

**Why does this problem matter? What happens if it remains unsolved?**

- Reduced time for direct patient care
- Increased risk of documentation errors
- Higher stress and workload for nurses

## SUCCESS CRITERIA

**What would improvement look like for the user?**

- Faster and simplified record updates
- Reduced manual data entry
- More time available for patient care
- Improved workflow efficiency

# 4. Insight Summary

## 01 Key Observations

- Nurses handle both patient care and heavy documentation tasks
- Multiple systems require repeated data entry
- Frequent interruptions delay record updates

## 02 Root Problem

- Manual documentation consumes significant time during shifts
- Inefficient systems increase workload and reduce care time

## 03 Evidence from User Behaviour

- Nurses prioritize patient care during emergencies
- Documentation is often completed later or after shifts
- Frequent system use for recording vitals and patient updates
