Design Thinking for AI Product Prototypes Masterclass

Day 3 Deliverable: Rapid Prototyping & Feedback Loops

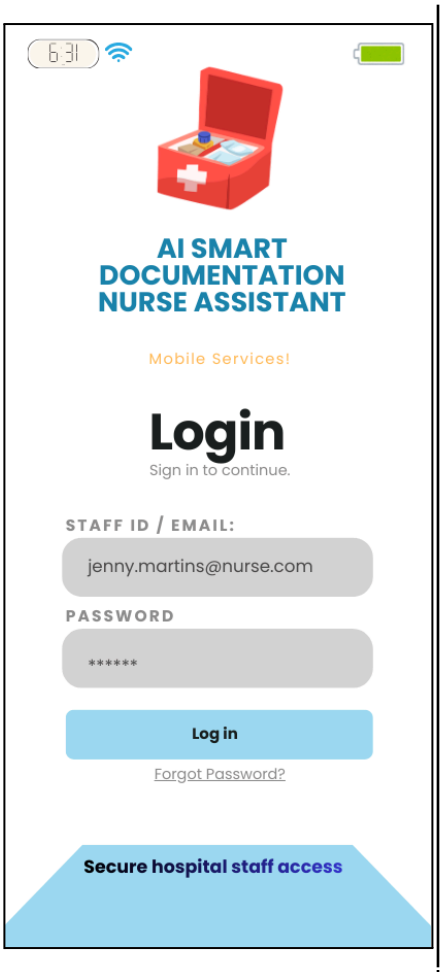
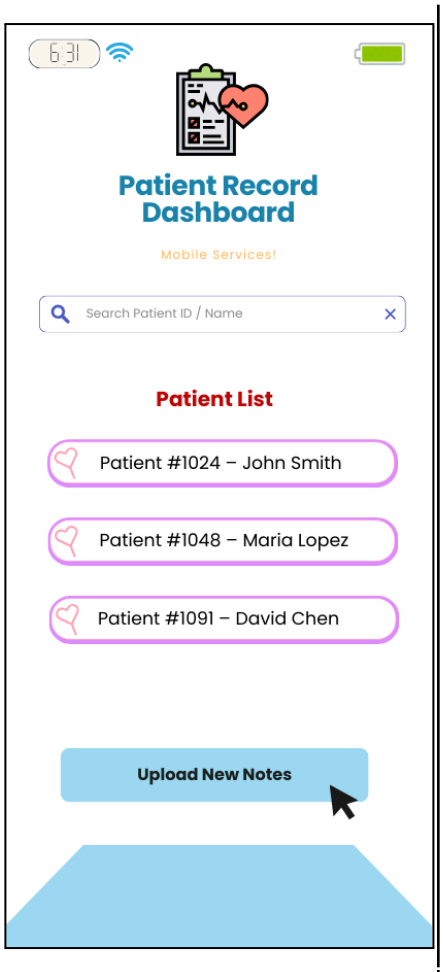
Domain: Healthcare

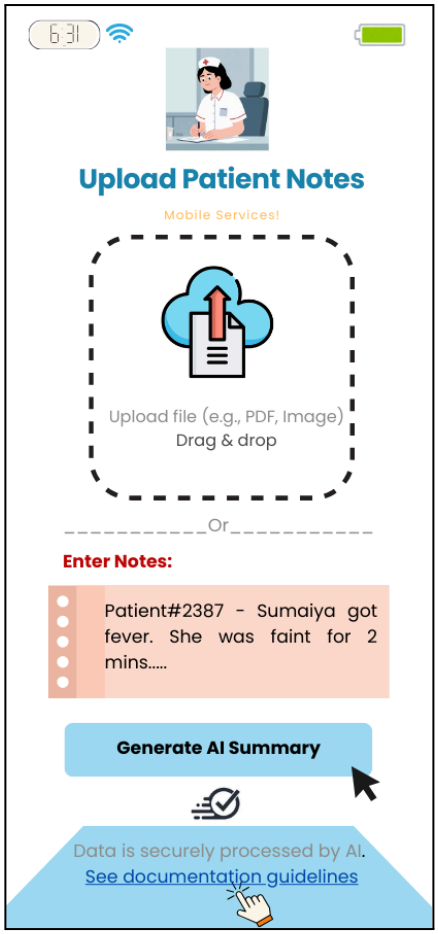
Chosen Target User Group: Hospital Nurse Managing Patient Records

1. Clickable Prototype

Link: [Nurse Wireframe Mobile UI Prototype (Canva View Link)]







Screen 1 – Login Screen

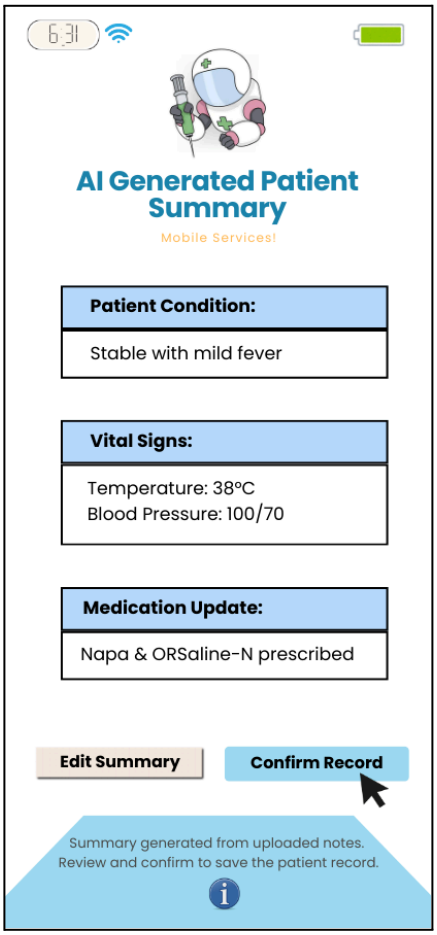
This screen allows hospital nurses to securely access the **AI Smart Documentation Assistant**.
The nurse enters their staff ID and password to log into the system and begin managing patient documentation

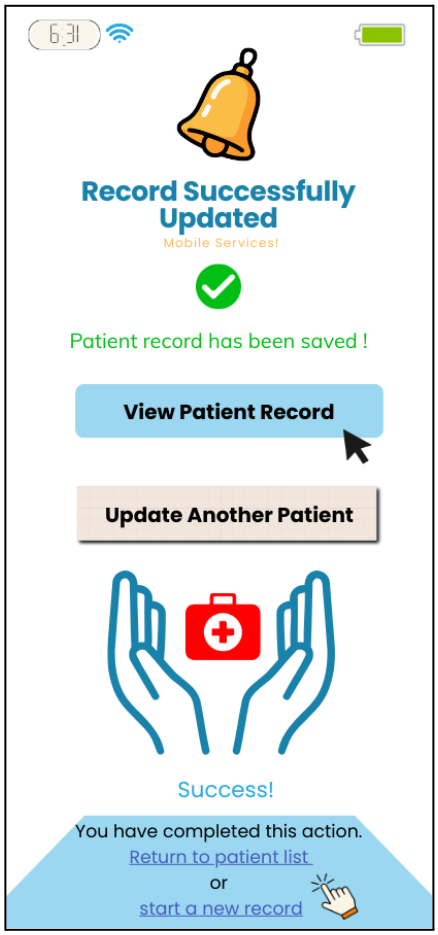
Screen 2 – Patient Record Dashboard

After logging in, the nurse is directed to the **patient record dashboard**.
Here the nurse can search for a patient using the patient ID or name and select an existing patient record from the list to update.

Screen 3 – Upload Patient Notes

In this step, the nurse uploads or enters **patient notes, vitals, or treatment updates**.
The nurse then clicks the **"Generate AI Summary"** button to allow the system to process the information.





Screen 4 – AI Generated Summary

The system automatically generates a **structured summary of the patient information**.

The nurse can review the AI-generated summary, make edits if needed, and ensure that the information is accurate before saving.

Screen 5 – Record Confirmation

After the nurse confirms the summary, the system saves the updated patient record.

This screen shows a **confirmation message** indicating that the patient documentation has been successfully updated.

Core User Flow

1. Nurse logs into the system.
2. Nurse selects or searches for a patient record.
3. Nurse uploads or enters patient notes.
4. AI generates a structured summary of the notes.
5. Nurse reviews and confirms the updated patient record.

Primary Interaction Points

- Nurse logs into the system securely.
- Nurse searches or selects a patient record.
- Nurse uploads or enters patient information.
- AI generates a summarized patient record.
- Nurse reviews, edits if necessary, and confirms the update.

2. Feedback Summary

Category	Point 1	Point 2	Point 3
What Worked Well	AI summary feature easy to understand	Patient search and selection simple	Workflow reduced manual documentation effort
What Didn't Work	Edit option not immediately obvious	Confirmation button needed better visibility	Upload step required clearer instructions
User Reactions	"The AI summary would save a lot of time."	"The flow is simple and easy."	"I wasn't sure where to confirm the record."

3. Key Insights

Insight Type	Findings
Repeated Usability Issues	**Users were unsure about the edit option and confirmation step**
Expectation vs Design	**Users expected clearer confirmation after updating records**
Validated / Disproved Assumptions	**Automatic summaries were useful, but users still wanted manual editing control**
Overall Pattern	**Users preferred a fast and simple review process rather than complex features**

4. Iteration Notes

Category	Changes
Changes Made	Improved navigation between screens; Added clearer confirmation button
Features Simplified	Reduced unnecessary steps in the upload and summary process
Next Improvements	Add voice note input for faster documentation; Improve clarity of AI-generated summaries
Reasoning	Confirmation button was improved because testers were unsure if records were saved
